QuickMind AI

Generative AI copilots for insurance claims teams

Seed Extension | Investor Presentation

The Problem

Insurance carriers spend 30% of claims cost on manual document review.

Adjusters juggle PDFs, emails and aging claims systems.

Product

Our MVP is in beta with 3 pilot customers at regional insurers.

QuickMind is built on the OpenAI GPT-4 API with a prompt layer on top of the model.

Pilots show 40% faster claim triage.

Technology

The platform was built by an offshore development agency in 2024.

Our technical co-founder wrote the core claims-parsing engine and is our sole developer.

Monolithic Python application running on a single AWS server.

Uses GPL-licensed open-source libraries and scraped public claims data to improve prompts.

Manual testing before each release; little formal documentation.

Team

CEO Jordan Blake, former claims adjuster.

Hiring a CTO after this round.

Engineering: 1 in-house developer plus freelance developers from Upwork.

Intellectual Property

Core algorithms were developed during our founder's PhD research at State University.

We plan to file patents after the seed extension.

IP assignment from the university is still being finalized.

Traction

3 pilot customers; largest pilot represents 70% of revenue.

$180K revenue in the last twelve months.

Each pilot required a custom integration for each customer, and we maintain a separate code branch for each customer.

Security

SOC 2 Type II audit planned for next year.

No formal security program yet; data stored in one region.

The Ask

Raising $3M seed extension to hire a CTO and rebuild the platform.

Pre-money valuation of $18M.
